

Better Cooling Reduces Recovery Time

This patient's leg was crushed in an accident. The swelling was expected to last 2 weeks, but after one day of cold therapy the hospital switched from their old pad (left) to Adroit's pad (right) and the swelling was down in 1 week! The patient also said the old pad's cooler was so loud he couldn't sleep.

Adroit's Cold Therapy Pads (Soft-Temp®) have significantly more patient contact area of ordinary pads. They also have a thin fabric layer that allows the pad to be placed directly against the patient's skin. These features allow Adroit pads to reduce swelling faster and more efficiently. Elastic straps with Velcro fasteners are standard. All cold pads are available sterile or non-sterile.
